Reflection

The purpose of the second assignment is to create a responsive website using HTML5 and CSS which is developed from the wireframes and inspiration board in assignment 1. The images above are my original sketches. There are some differences in the created website when comparing to the original sketches. First, there is a change with the image 'Robin Boyd' in the navigation bar because it is said that not to use the Boyd logo as the logo for the site, I changed the image to the text 'Home'. Second, I moved the title of each page from the heading image to the main content because I think it would look better and clearer. The third difference is the lay-out of main content. I have been familiar with HTML and CSS from the unit Introduction to IT but after doing the assignment 2 of Front-end Web Design, I have gained more knowledge in creating a website; for example, how to make a navigation bar by using unordered list. Moreover, this assignment mainly aims to create a responsive website which is suitable for using on different devices such as laptop, smartphone and tablet. I know how another way to make a responsive website by using Flexbox apart from Bootstrap. In addition, I have some problems when doing the assignment. Firstly, how to put the link of CSS in HTML file in a correct order so they can work properly. If I put my CSS style named mystyle above the CSS reset, then mystyle does not work because it is overridden by the CSS reset. Secondly, another problem I had is how to work with Flexbox to create a responsive website such as position of text, images or how to align items as I want. There are some resources that I found helpful when creating the website:

<https://htmlcolorcodes.com/color-picker/>
